Lab 1 Reflection

Ethan Ooi

Sept 22, 2026

Technical Description

I did the majority of the coding aspects for question 3. I also helped with providing guidance for part F of question 3 which compares the results of the different models/estimators I used in my code. I also established the main idea of using github for the team to work together as well as using that for our answer for question 4. As a team we all collectively worked on question 1 to develop our answer there collectively. I used Python libraries like pandas, numpy, and sklearn to build PLS and PLR model, predict permeability, and evaluate on testing sets. I explored with different penalties like Lasso, Ridge, and ElasticNet. I built pipelines to establish to prep data and establish the model.

Positive Critique

This was agreed upon as a group, but I know my teammates initially wanted to use Colab to work together, but I suggested using GitHub to collaborate which I was proud of. This specifically because I think everyone in coding & data science world should become very comfortable with using GitHub, collaborative repos, and branches in continuous integration & development. I think through our DS curriculum, Git hasn't been enforced as much as it needs to be and I think pushing on using Git and everyone being comfortable with it is super important and I'm happy that we ended up using Git for our project to collaborate.

Negative Critique

I think our entire group and myself did a great job in this lab, we all collaborated well. Going back to the GitHub point, I think for myself I need to also get better and understand the commands and not need to lookup how to do everything all the time. I think enforcing these good skills is super important. I made a mistake where I accidentally overrided main's code with mine and corrupted our jupyter notebook. I manually had to revert main's branch and combine my work and my teammates work. In Git, you should never have to manually combine code together, as it should all be done through Git itself using merges. This is something that I can definitely work on, and through mistakes like these is how I can learn and avoid them going forward.
